<b>Target version:</b>	
<b>Description</b> Redistributions could also support a two-phase-redistribution scheme, that has has two communication steps. This potentially allows for a reduction in the number of messages.  Some thoughts on this: <ul style="list-style-type: none"><li>• probably only reasonable for in-place redistributions (see <a href="#">#317</a>)</li><li>• the two phase could be detected in xmap-generation or redist-generation step</li></ul>
